    The present sequence represents a multiple sclerosis (MS) associated retrovirus (MSRV) genomic fragment used in the method of the invention. The invention provides complete or partial genomic sequences of the MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by these genes. The invention also provides antibodies raised against the polypeptides. The genomic sequences, polypeptides and antibodies are also claimed useful for diagnosing infection by MS and rheumatoid arthritisassociated viruses, and also for prevention and treatment of infection with these viruses
                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       780

                                                                                                               The invention relates to an isolated nucleic acid which comprises the gene of a retrovirus associated with multiple sclerosis or rheumatoid arthitis. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating multiple sclerosis and/or rheumatoid arthitis. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CAAAACCCTACTAACTGTTGGATGTGCCTCCCCTGCACTTCAGGCCATACATTTCAATC

                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents the nucleotide sequence corresponding to the 3' env region and long terminal repeat sequences from clone CL6 of Multiple Sclerosis retrovirus (MSRV-1). The specification describes a long terminal repeat (LTR) -RUS region which encodes the expression of a MSRV-1 protein. This is unusual for LTRs, in particular in the RUS the gion. The sequence includes CAAT and TARA signals which are present in the Usuand R regions and are not directed towards the CDS indicated in the features table. Probes and antibodies to the MSRV-1 retrovirus protein and encoding polymucleotide sequences are used to detect the presence of MSRV-1 retrovirus in a biological sample. (Updated on 06-AUG-2003 to correct OS field.)

The envelope protein expressed by the endogenous human retrovirus MRSV-1 has superantigen activity associated with autocimmune disease. The protien can be detected using the method of the invention. The specification describes a process for detecting activity of a superantigen in a biological sample. The process comprises identifying large scale expansion or loss of lymphocytes that carry at least one of the Vbeta16 and/or Vbeta17 determinants. The method is used to screen for agents that inhibit the superantigen, especially those associated with MRSV-1 which is implicated in autoimmune disease, particularly multiple stores.

These agents are potentially useful for treatment or prevention (e.g. as vaccines) of autoimmune diseases

primer for the amplification by polymerisation of a nucleic acid of a viral material associated with multiple sclerosis or rheumatoid arbritis, a polypeptide exhibiting an inhibitory activity on the proteolytic, reverse transcriptase or ribonuclease H activity from MSRV, and an antibody directed against the MSRV-1 virus obtained by immunologically reacting a human or animal body or cells with an immunogenic agent consisting of the antigenic polypeptide defined above. The nucleic acids are useful for detecting a biological sample a virus associated with multiple sclerosis or rheumatoid arthritis, or for detecting in a biological sample, the presence of or exposure to a virus associated with multiple sclerosis or rheumatoid arthritis. The present cancinate minimal MSRV-associated sequence whose identity cannot be accurately determined. Note: The SEQ ID numbers for the sequences as a claimed MSRV-associated sequence whose identity cannot be constituted in the main body of the patent do not match the SEQ ID numbers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AGCACCCTAGCCCCTACAAAGGACTAGTTCTCTCAAAACTACATGAAACCTCCGTACN 480

The nucleic acids comprise pol, gas or reverse transcriptase genes (or their fragments) encoding the proteins or defined peptides (including immunodominant peptides, antigenic peptides or conserved motifs). Also included are a process for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample, a nucleic acid probe for the detection of a virus associated with multiple sclerosis or rheumatoid arthritis, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated or purified nucleic acid associated with multiple sclerosis and/or rheumatoid arthritis, useful for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ψ.

and mucleic acid molecules encoding such proteins. EMBRY sequences are useful for screening modulators useful for treating or preventing disorders associated with abnormal expression of EMBRY. The disorders treated include reproductive disorders such as infertility, endometriosis, endometrial or ovarian tumour; autoimmune/inflammatory endometriosis, endometrial or ovarian tumour; autoimmune/inflammatory contact dermatitis; disorders of the placenta such as precelampsia, abruptic placentes etc. Sequences of the invention are also useful for analysing a proteome of a tissue or a cell type. EMBRY proteins are useful as immunogens for preparing antibodies. Polynucleotides of the invention are useful disorders. They are also useful is a managenic animals to model human diseases. They are also used in gene therapy. The animals to model human diseases. They are also used in gene therapy. The

The invention relates to identifying compounds which are modulators of syncytin expression. The syncytin modulators are useful in diagnosis and treatment of precelampsia and gestational trophoblast disorders (e.g. choriocarcinoma, hydatiform mole, placental site tumour and missed, incomplete abortion). Syncytin is a human gene derived from the envelope gene of human endogenous defective retrovirus, HRRV-W. The present invention is based partly on the discovery that syncytin expression is dramatically reduced in precelampsia, and is also mis-localised to the apical syncytiotrophoblast membrane. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a compound for treating a subject with or at risk of developing preeclampsia, comprises determining whether the expression or activity of syncytin in the cell is modulated in the presence of a test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACGCGGCTTCCTGGAAATATTGATGCCCCATCATATAGGAGTTTATCTAAGGGAAACTCC

This invention describes novel human secreted proteins encoded by polynucleotides isolated from human adult testes, adult brain, adult blood or adult placenta, or murine adult bone marrow or thymus cDNA libraries. The products of the invention are predicted to have biological activities which would make them suitable for treating, preventing or supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haemacopoiesis regulating activity, tissue growth activity, among activity, chemotating activity, the superessing activity, activity, chemotating activity, the superessing activity, activity, chemotating chemotatic/chemokinetic activity, activity, receptor/ligand activity, and thrombolytic activity, receptor/ligand activity, and thrombolytic activity, receptor/ligand activity, and tumour invalud suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Secreted protein; testes; brain; blood; placenta; human; murine; thymus; bone marrow; treatment; prevention; nutrition; cytokine; immune; vaccine; cell proliferation; cell differentiation; suppressor; tumour inhibition; haematopoiesis regulator; activin; inhibin; chemotactic; chemokinetic; haemostatic; thrombolytic; receptor; ligand; anti-inflammatory; tumour; cadherin; tumour invasion suppressor; gene therapy; tissue growth; ss.

                                                           This is the human secreted protein AJ172 2 nucleotide sequence, obtained from a human adult testes CDNA library. The invention relates to secreted human and murine proteins. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Detection of the levels of the proteins can be used for the diagnosis of e.g. pre-eclampsia, placental pathology or cancer. Agents which modulate the expression or function of the proteins may be used for treating a neoplastic disease and inhibiting metastasis. Other suggested activities include nutritional activity (e.g. in feeds), cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopolesis regulating activity, itsue growth activity, activity, haematopolesis regulating activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a protein comprising fully defined A2302 1

protein or BD127 1 6 protein. The polynucleotides are useful for

protein or BD127 1 6 protein. The polynucleotides are useful for

chromosome markers or tags to identify chromosomes or to map related gene

chromosome markers or tags to identify chromosomes or to map related gene

continue. The proteins are useful as amino acid supplement, carbon

source, nitrogen source and carbohydrate source. The proteins are useful

for treating various immune deficiencies and disorders (e.g. severe

combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple

solerosis, systemic lupus erythematosus, rheumatoid atthritis), allergic

reactions (e.g. asthma), myeloid coll deficiencies,

osteoporosis or osteoarthritis, peripheral nervous system diseases (e.g.

peripheral neuropathy, Alzheimer's disease, Parkinson's disease),

coagulation disorders, inflammatory diseases (e.g. systemic inflammatory

response syndrome (SIRS), ischaemiar repertusion injury, Crohn's disease,

coagulation munuity, for inducing bone, cartilage, tendon, ligament and/or

nerve growth or regeneration, for proliferating neural cells and for

regenerating nerve and brain tissue, for inducing fertility and for

combinity ing tumour growth. Proteins are also useful for inducing tendon, and also

mammalian cells (e.g., monocytee, fibroblasts, neutrophils), and also

cuseful as inhibitors of receptor/ligand interactions. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Proteins A23021 encoded by clone A23021 from human adult colon, and BD12716 encoded by clone BD12716 from human fetal kidney cDNA library, useful for treating e.g. multiple sclerosis and rheumatoid arthritis.

```
cc endogenous retrovirus (HERVs) the full length endogenous provirus which was been located on the long arm of human chromosome 7 (7q21-22) has been designated HERV-W. The present invention describes proteins or peptides (1) having superantigen (SA9) activity comprising the ENV protein (ENV) of HERV-W the surface protein (SU) and transmembrane (TM) sub-units. (I) have neuroprotective activity, and can be used in: vaccines; antisensetherapy; and HERV-W SAG activity-inhibitors. (I) and encoding DNA/RNA are useful for diagnoshing multiple sclerosis (MS) or HERV-W-associated disorders. (I) are also useful for identifying substances (and optionally crecovering) capable of binding to a retroviral superantigen associated with MS, substances capable of binding to a retroviral superantigen of blocking SAG activity and substances capable of blocking SAG activity and substance capable of blocking spable of Generating an immune response devoid of SAG activity and being capable of generating an immune response capable of blocking SAG activity, capable of blocking transcription or capable of blocking transcription or translation of HERV-W retroviral superantigen for use in treating or capable of blocking sAG activity, capable of blocking transcription or translation of HERV-W retroviral superantigen for use in treating or capable of blocking sAG activity, capable of blocking transcription or translation of MS. (I) and nucleic acids encoding them are useful for diagnosing autoimmune disease. The present sequence encodes the specifically claimed envelope protein of HERV-W designated G

The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Regulatory elements associated with HERV-7q may alter expression of ther genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immunotherapy. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, neuropathologies or other autoimmune diseases. The present sequence was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             450
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
